The Fact Sheet on microFIT from our friends at Solar Brokers Canada

microFIT homes are an exclusive club

With current government incentives coming to an end, Ontario homeowners are becoming increasingly keen on taking advantage of the Ontario microFIT program. There's just one problem -- grid capacity.

Simply put, grid capacity is a strict limit of renewable energy that can be generated during peak times. That means, if one of your neighbors decides to move forward with a solar energy system before you do, your local distribution company may not be able to safely handle any additional power -- which means your application will get denied.

Don't let this happen to you! Join the exclusive club of smart homeowners who are having their systems paid for by this once-in-a-lifetime Feed-in Tariff program.

microFIT homes can generate a monthly income

With current government incentives ending this year, some homeowners may be wondering why they should quickly move forward and not wait until next year and take advantage of the new net metering program that will be in place.

There's a simple answer: income. Net metering, which is a program that currently exists in California, allows you to save money right at the meter-generating energy and directly offsetting the amount you use from the grid. microFIT, however, allows you to sell your energy back to the grid for more than two times the value you pay for it. You'll be able to generate a monthly income for the life of the 20-year contract.

How many investments do you know that can generate a 200% return?

microFIT systems pay for themselves

With current government incentives ending soon, homeowners are becoming increasingly interested in going solar—but may be apprehensive about the investing. What many don't realize, though, is that with these incentives a system can pay for itself.

The concept seems a little sensationalized, but it's true. As a microFIT home, you'll sell energy back to the grid at twice the cost of energy in Ontario—and you'll get paid monthly. These cheques will either cover the low cost of comfortable financing or repay the total upfront investment should you purchase it out right.

On average, homeowners can pay their systems off completely after only seven years.

Once paid off, homeowners will continue to receive monthly income for the remainder of the 20-year contract. That's like moving in a tenant who doesn't take up any space—and never forgets to pay rent.

microFIT systems increase your home's market value

Whether you plan to move or not, installing a solar system makes sense. Unlike most investments, it's an appreciating asset that will add the system's value to the overall value of your home, while earning 200% on the initial investment.

As part of Ontario Climate Change Action Plan, energy audits will be necessary for all homes entering the housing market by 2019. This means that going solar, as factored into the overall efficiency of your home, will not only pay for itself but increase your home's ability to sell.
